

Document Title	Specification of Ethernet State
	Manager
Document Owner	AUTOSAR
Document Responsibility	AUTOSAR
Document Identification No	415
Document Classification	Standard
Document Status	Final
Part of AUTOSAR Release	4.2.2

	Document Change History		
Release	Changed by	Change Description	
4.2.2	AUTOSAR Release Management	 Harmonize Sequence diagrams, Network State Machine and Functional Description Debugging support marked as obsolete Report to DET if Tcplp state is not accepted Adaptations related to renaming of DET, Error Handling: tables for Runtime Errors and Transient Faults added 	
4.2.1	AUTOSAR Release Management	 Change from Synchronous to Asynchronous API Additional callback functions added Existing behavior of functions changes Editorial changes 	
4.1.3	AUTOSAR Release Management	 Corrective action after timeout Non mutually exclusive transitions from ETHSM_STATE_ONLINE Editorial changes 	
4.1.2	AUTOSAR Release Management	 Optimization of full com request Standardization of internal state names Asynchronous behavior of several interfaces Several clarifications and corrections Editorial changes Removed chapter(s) on change documentation 	
4.1.1	AUTOSAR Administration	 New State Machine (new sub states and new state conditions, new APIs) Update chapter 10 Added Production Error if Transceiver Link is down General Update (corrections and formulations) 	
4.0.3	AUTOSAR Administration	Update Chapter 10 (Parameter adjustment)	

	Document Change History		
Release	Changed by	Change Description	
3.1.5	AUTOSAR Administration	 Functional changes: Correction of the naming convention of SW modul version information Correction of chapter 10 - configuration parameter "EthSMNetworkIndex" Remove InstanceID from GetVersionId structure Additional callback function: Call of SoAd_BusSM_ModeIndication realized after the successful initialization of the EthTrcv and the EthController. Non functional changes: Adding a self loop with "No initialization" in the state diagramm 	
3.1.4	AUTOSAR Administration	Initial Release	

Disclaimer

This specification and the material contained in it, as released by AUTOSAR, is for the purpose of information only. AUTOSAR and the companies that have contributed to it shall not be liable for any use of the specification.

The material contained in this specification is protected by copyright and other types of Intellectual Property Rights. The commercial exploitation of the material contained in this specification requires a license to such Intellectual Property Rights.

This specification may be utilized or reproduced without any modification, in any form or by any means, for informational purposes only. For any other purpose, no part of the specification may be utilized or reproduced, in any form or by any means, without permission in writing from the publisher.

The AUTOSAR specifications have been developed for automotive applications only. They have neither been developed, nor tested for non-automotive applications.

Advice for users

AUTOSAR specifications may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the specifications for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such specifications, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Introduction and functional overview

This specification specifies the functionality, API and the configuration of the AUTOSAR Basic Software module Ethernet State Manager.

In the AUTOSAR Layered Software Architecture, the Ethernet State Manager belongs to the ECU Abstraction Layer, or more precisely, to the Communication Hardware Abstraction.

The main task of the Ethernet State Manager can be summarized as follows:

[SWS_EthSM_00001]

[The Ethernet State Manager shall provide an abstract interface to the AUTOSAR Communication Manager to startup or shutdown the communication on an Ethernet cluster. | ()

[SWS_EthSM_00002]

[The Ethernet State Manager does not directly access the Ethernet hardware (Ethernet Communication Controller and Ethernet Transceiver), but by means of the Ethernet Interface. The Ethernet Interface redirects the request to the appropriate driver module.] ()

This is an example of an Autosar architecture including an Ethernet network.

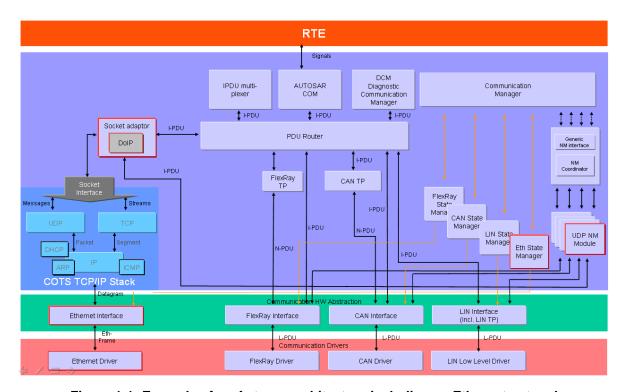

Figure 1-1: Example of an Autosar architecture including an Ethernet network

2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
API	Application Program Interface
BSW	Basic Software
BswM	Basic Software Mode Manager
ComM	Communication Manager
DEM	Diagnostic Event Manager
DET	Default Error Tracer
EcuM	ECU State Manager
Eth	Ethernet Controller
EthTrcv	Ethernet Transceiver
EthSM	Ethernet State Manager
Ethlf	Ethernet Interface
SchM	BSW Scheduler
SoAd	Socket Adapter

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [17] (SWS BSW General), which is also valid for Ethernet State Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for Ethernet State Manager.

4 Constraints and assumptions

4.1 Limitations

The EthSM can be used for Ethernet communication only. Its dedication is to operate with the EthIf to control one or multiple underlying Ethernet Controllers and Ethernet Transceiver Drivers. Other protocols than Ethernet (i.e. CAN, LIN or FlexRay) are not supported.

The following items are not supported by the current version of this specification.

Wake on LAN

The actual EthSM requires an IP-based communication stack. To get FULL_COMMUNICATION it is necessary to get an active IP communication. In further specifications, an alternative "low level" state machine will be introduced. This state machine only works on driver/transceiver level (without IP communication). This is necessary to realize other communication protocols (e.g. IEEE 1722).

4.2 Applicability to car domains

The Ethernet State Manager can be used for all domain applications always when the Ethernet protocol is used. The Ethernet BSW Stack can be used wherever high data rates are required.

5 Dependencies to other modules

AUTOSAR BSW Scheduler

The BSW Scheduler calls the main functions of the EthSM, which are necessary for the cyclic processes of the EthSM.

AUTOSAR Communication Manager

The ComM requests network communication modes and is notified by the EthSM when a communication mode is reached.

AUTOSAR Ethernet Interface

The EthSM uses the API of the EthIf to initialize the Ethernet Communication Hardware and to control the operating modes of the Ethernet Controllers and Ethernet Transceivers assigned to the Ethernet Networks.

The Ethernet Interface uses the API of the EthSM to provide the transceiver link state.

AUTOSAR Default Error Tracer

In order to be able to report development errors, the Ethernet State Manager has to have access to the error hook of the Default Error Tracer.

AUTOSAR Diagnostic Event Manager

In order to be able to report production errors the Ethernet State Manager has to have access to the Diagnostic Event Manager.

ECU State Manager

The EcuM initializes the EthSM.

AUTOSAR Bsw Manager

The BswM is notified by the EthSM when an internal state is reached.

AUTOSAR Tcplp

Tcplp is called to request the TCPIP state (e.g. Online, Offline, On Hold, ...). TcpIP uses the API of the EthSM to provide the TCPIP state.

5.1 File structure

5.1.1 Code file structure

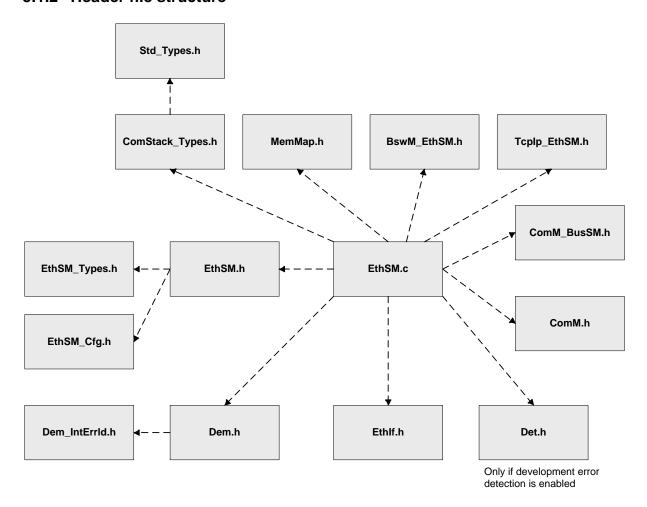

For details refer to the chapter 5.1.6 "Code File Structure" in SWS_BSWGeneral.

Remark:

Actually the module EthSM doesn't provide link time configuration and post-build time configuration.

5.1.2 Header file structure

[SWS_EthSM_00004] [

The header file EthSM.h shall export EthSM module specific types and API's. | ()

[SWS EthSM 00006] [

The header file EthSM_Types.h exports the EthSM specific types.| ()

[SWS EthSM 00007] [

The EthSM implementation (EthSM.c) shall include its header file EthSM.h to get access to its own API declaration and to its configuration parameters.] ()

[SWS_EthSM_00008] [

The EthSM needs to report development errors if development errors are enabled by configuration. Therefore, it includes the header file Det.h.] ()

[SWS_EthSM_00010] [

The EthSM implementation (EthSM.c) references the API of the EthIf. Therefore, it includes the header file EthIf.h.| ()

Note:

The header file ComM_BusSM.h shall export the part of the ComM API required by EthSM.

[SWS_EthSM_00013]][

The EthSM module shall include the ComM_Bus_SM.h header file. J()

Note:

The header file BswM_EthSM.h shall export the part of the BswM API required by EthSM.

[SWS_EthSM_00080]][

The EthSM module shall include the BswM_EthSM.h header file. ()

Note: The header file Tcplp_EthSM.h shall export the part of the Tcplp API required by EthSM.

[SWS_EthSM_00106]][

The EthSM module shall include the Tcplp_EthSM.h header file |()

[SWS_EthSM_00189]][

The EthSM module shall include the header file ComM.h.

Rationale: Some APIs of the EthSM use type definitions of the ComM module. |()

5.1.3 Version Check

For details refer to the chapter 5.1.8 "Version Check" in SWS_BSWGeneral.

	All software modules shall provide version and identification information	SWS_EthSM_00046, SWS_EthSM_00060
SRS_BSW_00005	Modules of the µC Abstraction Layer (MCAL) may not have hard coded horizontal interfaces	SWS_EthSM_00999
SRS_BSW_00010	The memory consumption of all Basic SW Modules shall be documented for a defined configuration for all supported platforms.	SWS_EthSM_00999
SRS_BSW_00101	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	SWS_EthSM_00043
SRS_BSW_00159	All modules of the AUTOSAR Basic Software shall support a tool based configuration	SWS_EthSM_00081
SRS_BSW_00160	Configuration files of AUTOSAR Basic SW module shall be readable for human beings	SWS_EthSM_00999
SRS_BSW_00161	The AUTOSAR Basic Software shall provide a microcontroller abstraction layer which provides a standardized interface to higher software layers	SWS_EthSM_00999
SRS_BSW_00162	The AUTOSAR Basic Software shall provide a hardware abstraction layer	SWS_EthSM_00999
SRS_BSW_00164	The Implementation of interrupt service routines shall be done by the Operating System, complex drivers or modules	SWS_EthSM_00999
SRS_BSW_00168	SW components shall be tested by a function defined in a common API in the Basis-SW	
SRS_BSW_00170	The AUTOSAR SW Components shall provide information about their dependency from faults, signal qualities, driver demands	SWS_EthSM_00999
SRS_BSW_00306	AUTOSAR Basic Software Modules shall be compiler and platform independent	SWS_EthSM_00999
SRS_BSW_00308	AUTOSAR Basic Software Modules shall not define global data in their header files, but in the C file	SWS_EthSM_00999
SRS_BSW_00309	All AUTOSAR Basic Software Modules shall indicate all global data with read-only purposes by explicitly assigning the const keyword	SWS_EthSM_00999
SRS_BSW_00314	All internal driver modules shall separate the interrupt frame definition from the service routine	SWS_EthSM_00999
SRS_BSW_00318	Each AUTOSAR Basic Software Module file shall provide version numbers in the header file	SWS_EthSM_00060

SRS_BSW_00321	The version numbers of AUTOSAR Basic Software Modules shall be enumerated according specific rules	SWS_EthSM_00999
SRS_BSW_00325	The runtime of interrupt service routines and functions that are running in interrupt context shall be kept short	
SRS_BSW_00326	-	SWS_EthSM_00999
SRS_BSW_00328	All AUTOSAR Basic Software Modules shall avoid the duplication of code	SWS_EthSM_00999
SRS_BSW_00331	All Basic Software Modules shall strictly separate error and status information	SWS_EthSM_00999
SRS_BSW_00333	For each callback function it shall be specified if it is called from interrupt context or not	
SRS_BSW_00334	All Basic Software Modules shall provide an XML file that contains the meta data	SWS_EthSM_00999
SRS_BSW_00336	Basic SW module shall be able to shutdown	SWS_EthSM_00999
SRS_BSW_00341	Module documentation shall contains all needed informations	SWS_EthSM_00999
SRS_BSW_00343	The unit of time for specification and configuration of Basic SW modules shall be preferably in physical time unit	SWS_EthSM_00999
SRS_BSW_00344	BSW Modules shall support link-time configuration	SWS_EthSM_00999
SRS_BSW_00345	BSW Modules shall support pre-compile configuration	SWS_EthSM_00061
SRS_BSW_00347	A Naming seperation of different instances of BSW drivers shall be in place	SWS_EthSM_00999
SRS_BSW_00353	All integer type definitions of target and compiler specific scope shall be placed and organized in a single type header	SWS_EthSM_00999
SRS_BSW_00355	-	SWS_EthSM_00999
SRS_BSW_00358	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	SWS_EthSM_00043
SRS_BSW_00359	All AUTOSAR Basic Software Modules callback functions shall avoid return types other than void if possible	SWS_EthSM_00999
SRS_BSW_00360	AUTOSAR Basic Software Modules callback functions are allowed to have parameters	SWS_EthSM_00999
SRS_BSW_00361	All mappings of not standardized keywords of compiler specific scope shall be placed and organized in a compiler specific type and keyword header	SWS_EthSM_00999
SRS_BSW_00369	All AUTOSAR Basic Software Modules shall not return specific development error codes via the API	SWS_EthSM_00999
SRS_BSW_00371	The passing of function pointers as API parameter is forbidden for all AUTOSAR	SWS_EthSM_00999

	In	T
	Basic Software Modules	
SRS_BSW_00373	The main processing function of each AUTOSAR Basic Software Module shall be named according the defined convention	SWS_EthSM_00999
SRS_BSW_00374	All Basic Software Modules shall provide a readable module vendor identification	SWS_EthSM_00060
SRS_BSW_00375	Basic Software Modules shall report wake- up reasons	SWS_EthSM_00999
SRS_BSW_00377	A Basic Software Module can return a module specific types	SWS_EthSM_00999
SRS_BSW_00379	All software modules shall provide a module identifier in the header file and in the module XML description file.	SWS_EthSM_00060
SRS_BSW_00387	-	SWS_EthSM_00999
SRS_BSW_00395	The Basic Software Module specifications shall list all configuration parameter dependencies	SWS_EthSM_00999
SRS_BSW_00398	The link-time configuration is achieved on object code basis in the stage after compiling and before linking	
SRS_BSW_00399	Parameter-sets shall be located in a separate segment and shall be loaded after the code	SWS_EthSM_00999
SRS_BSW_00400	Parameter shall be selected from multiple sets of parameters after code has been loaded and started	SWS_EthSM_00999
SRS_BSW_00406	A static status variable denoting if a BSW module is initialized shall be initialized with value 0 before any APIs of the BSW module is called	
SRS_BSW_00407	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	
SRS_BSW_00413	An index-based accessing of the instances of BSW modules shall be done	SWS_EthSM_00999
SRS_BSW_00414	Init functions shall have a pointer to a configuration structure as single parameter	SWS_EthSM_00043
SRS_BSW_00416	The sequence of modules to be initialized shall be configurable	SWS_EthSM_00999
SRS_BSW_00417	Software which is not part of the SW-C shall report error events only after the DEM is fully operational.	SWS_EthSM_00999
SRS_BSW_00423	BSW modules with AUTOSAR interfaces shall be describable with the means of the SW-C Template	SWS_EthSM_00999
SRS_BSW_00424	BSW module main processing functions shall not be allowed to enter a wait state	SWS_EthSM_00081
SRS_BSW_00425	The BSW module description template shall provide means to model the defined trigger conditions of schedulable objects	SWS_EthSM_00081

SRS_BSW_00426	BSW Modules shall ensure data consistency of data which is shared between BSW modules	SWS_EthSM_00999
SRS_BSW_00427	ISR functions shall be defined and documented in the BSW module description template	SWS_EthSM_00999
SRS_BSW_00428	A BSW module shall state if its main processing function(s) has to be executed in a specific order or sequence	SWS_EthSM_00999
SRS_BSW_00429	BSW modules shall be only allowed to use OS objects and/or related OS services	SWS_EthSM_00999
SRS_BSW_00432	Modules should have separate main processing functions for read/receive and write/transmit data path	SWS_EthSM_00999
SRS_BSW_00433	Main processing functions are only allowed to be called from task bodies provided by the BSW Scheduler	SWS_EthSM_00999
SRS_BSW_00437	Memory mapping shall provide the possibility to define RAM segments which are not to be initialized during startup	SWS_EthSM_00999
SRS_BSW_00438	Configuration data shall be defined in a structure	SWS_EthSM_00999

7 Functional specification

An ECU can have different communication networks. Each network has to be identified with a unique network handle. The ComM requests communication modes from the networks. It knows by its configuration, which handle is assigned to what kind of network. In case of Ethernet, it uses the Ethernet state manager, which is responsible for the control flow abstraction of Ethernet networks. The following sections describe this in detail.

7.1 Translation of network communication mode requests

[SWS_EthSM_00014] [

The EthSM shall provide to the ComM an API, which can be used by the ComM to request communication modes of Ethernet networks.| ()

[SWS_EthSM_00015][

Depending on the parameters handed over by this API, the EthSM shall execute a state transition of the related network mode state machine (refer to section 7.6). | ()

[SWS_EthSM_00016][

This transition shall translate the request into a respective API call to control the assigned Ethernet peripherals. ()

7.2 Output of current network communication modes

The current communication mode of a network can be different from the requested mode. The EthSM has to provide the information on the current communication mode to the ComM by the two following kind of interfaces:

[SWS_EthSM_00017][

The EthSM shall provide an API, which can be polled by the ComM to get the current communication mode of an Ethernet network. | ()

[SWS EthSM 00018][

The EthSM shall use a call out function of ComM to notify ComM of a change in communication modes.| ()

7.3 Control of peripherals

7.3.1 Ethernet Transceivers

One or more Ethernet transceivers belong to a certain Ethernet network (handle).

The assignment between network handles and transceivers shall be part of the EthSM configuration (see chapter 10.2).| ()

[SWS_EthSM_00020][

The EthSM shall control the Ethernet transceivers depending on the state transitions of its network mode state machines. ()

[SWS EthSM 00021][

The EthSM shall use the API of the EthIf for the control of the Ethernet transceiver modes.| ()

7.3.2 Ethernet Controllers

One or more Ethernet controllers belong to a certain Ethernet network (handle).

[SWS_EthSM_00022][

Depending on the network mode state machine, the EthSM shall control the Ethernet controller modes of each Ethernet network. | ()

[SWS_EthSM_00023][

The EthSM shall use the API of the EthIf to control the operating modes of the assigned Ethernet controllers. | ()

7.4 Multiple networks

The Ethernet State Manager shall be able to handle separate networks. This concerns separate physical networks (see also chapter 7.3) and also separate VLAN's on the same physical network.

In both cases, the separation is done by separate handles per physical or virtual network. VLANs appear on higher layers (ComM) as separate networks. E.g.: If there is one physical Ethernet controller and two VLANs assigned to it, two ComM channels exists.

7.5 Background and Rationale

Explanation:

The application is responsible to recognize if the Ethernet network is needed or not.

One possible use case could be the usage of the Ethernet network in a tester connection (see description below).

Use Case: Use Ethernet in a tester connection

For example, the detection could takes place over a separate hardware pin of the ECU. In this case, the activation of the hardware pin and therefore the activation of the Ethernet network can only realized through the offboard-diagnostic tester. Reasons for the deactivation of the Ethernet network could be:

The tester deactivate via the separate hardware pin the network

- The application deactivate the network
- The application recognize a timeout
- The link status of the network failed

[SWS_EthSM_00038] [

The ComM calls the EthSM to request a certain communication mode. The Ethernet network only needs the communication modes FULL_COMMUNICATION and NO COMMUNICATION. | ()

[SWS EthSM 00085][

If FULL_COMMUNICATION is requested the Ethernet controller and the Ethernet transceiver are set to the state ACTIVE. To reach FULL_COMMUNICATION it is also necessary to get an ACTIVE link state (Ethernet cable is connected) and an ONLINE TcpIP state (IP communication is available). The link state will be detected by the Ethernet Transceiver module and will be communicated by the Ethernet Interface. The TcpIP state will be detected and communicated by the TcpIp module.] ()

[SWS_EthSM_00086][

If the ComM request NO_COMMUNICATION the Ethernet controller and the Ethernet transceiver are set to the state DOWN. ()

Remark:

For the de-initialization no separate interface is necessary, the de-initialization is automatically realized in the Ethlf.

It is also necessary to set the Tcplp state to OFFLINE.

[SWS EthSM 00087][

The Ethernet network has to be wake up by the application and it's either on (FULL_COMMUNICATION) or off (NO_COMMUNICATION). So there is no need for other states e.g. like SILENT COMMUNICATION. ()

7.6 Network mode state machine

[SWS EthSM 00024][

The EthSM shall implement for each configured network handle one network mode state machine. The internal states are described in the Fig. 7-1 [SWS_EthSM_00041].| ()

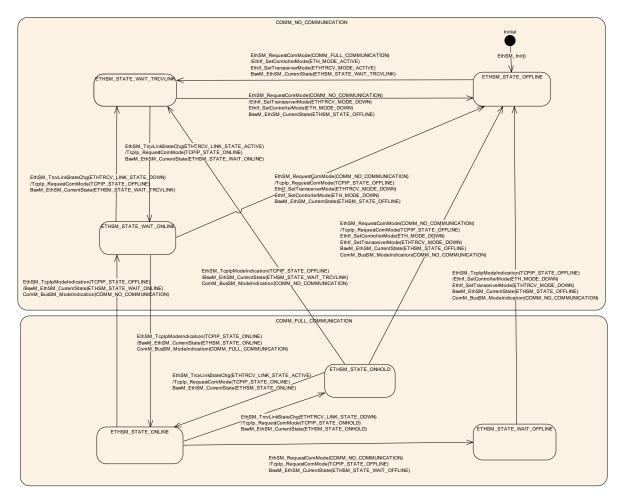

Figure 7-1: Network mode state machine of the EthSM

The Ethernet State Manager network mode state machine includes six sub states:

NO_COMMUNICATION	ETHSM_STATE_OFFLINE
	ETHSM_STATE_WAIT_TRCVLINK
	ETHSM_STATE_WAIT_ONLINE
FULL_COMMUNICATION	ETHSM_STATE_ONLINE
	ETHSM_STATE_ONHOLD
	ETHSM_STATE_WAIT_OFFLINE

The table below shows the detailed conditions of the sub states:

State	Controller Mode	Transceiver Mode	Transceiver Link	TcpIP Address	ComM Mode
ETHSM_STATE_OFFLINE	DOWN	DOWN	DOWN	OFFLINE	No Communication
ETHSM_STATE_WAIT_TRCVLINK	ACTIVE	ACTIVE	DOWN	OFFLINE	No Communication
ETHSM_STATE_WAIT_ONLINE	ACTIVE	ACTIVE	ACTIVE	OFFLINE	No Communication
ETHSM_STATE_ONLINE	ACTIVE	ACTIVE	ACTIVE	ONLINE	Full Communication
ETHSM_STATE_ONHOLD	ACTIVE	ACTIVE	DOWN	ONLINE	Full Communication
ETHSM_STATE_WAIT_OFFLINE	ACTIVE	ACTIVE	ACTIVE	ONLINE	Full Communication

To reach COMM_FULL_COMMUNICATION following conditions are necessary:

- Ethernet controller and transceiver are active
- The transceiver link state is active
- An active IP communication is available

The first step is set the controller and the transceiver to ACTIVE. After this is done, the Ethernet State Manager is in the sub state ETHSM_STATE_WAIT_TRCVLINK. In this sub state the state manager has to wait for the monitored link state information of the transceiver. After the link state is set to ACTIVE, the Ethernet State Manager is in the sub state ETHSM_STATE_WAIT_ONLINE.

In this sub state the state manager has to wait for the monitored Tcplp state information of the Tcplp module. After the TcplP state is set to ACTIVE (= IP communication is available), the Ethernet State Manager is in the sub state ETHSM STATE ONLINE.

→ Now FULL_COMMUNICATION is reached.

7.6.1 Initial transition

[SWS_EthSM_00025] [

After the initialization of the EthSM the state machine shall have a transition to ETHSM_STATE_OFFLINE.

The initialization of the EthSM causes no further transactions in other modules. So no separate sequence diagram is needed. ()

7.6.2 Transition between substate WAIT_TRCVLINK and OFFLINE

[SWS EthSM 00026] [

In the state ETHSM_STATE_OFFLINE the state machine shall have a transition to ETHSM_STATE_WAIT_TRCVLINK, if the ComM requests COMM_FULL_COMMUNICATION for the corresponding network handle. In this

transition the EthSM shall interact like specified in the sequence diagram Figure 9-1.

[SWS_EthSM_00088] [

The transition from ETHSM_STATE_OFFLINE to ETHSM_STATE_WAIT_TRCVLINK set the controller mode to ETH_MODE_ACTIVE. | ()

[SWS_EthSM_00089] [

The transition from ETHSM_STATE_OFFLINE to ETHSM_STATE_WAIT_TRCVLINK set the transceiver mode to ETHTRCV MODE ACTIVE.I ()

[SWS_EthSM_00097][

After the successful transition from ETHSM_STATE_OFFLINE to ETHSM_STATE_WAIT_TRCVLINK the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_WAIT_TRCVLINK.| ()

[SWS EthSM 00127] [

In the state ETHSM_STATE_WAIT_TRCVLINK the state machine shall have a transition to ETHSM_STATE_OFFLINE, if the ComM requests COMM_NO_COMMUNICATION for the corresponding network handle.| ()

[SWS_EthSM_00128] [

The transition from ETHSM_STATE_WAIT_TRCVLINK to ETHSM STATE OFFLINE sets the controller mode to ETH MODE DOWN. I ()

[SWS EthSM 00129] [

The transition from ETHSM_STATE_WAIT_TRCVLINK to ETHSM_STATE_OFFLINE sets the transceiver mode to ETHTRCV_MODE_DOWN. | ()

[SWS_EthSM_00130][

After the successful transition from ETHSM_STATE_WAIT_TRCVLINK to ETHSM_STATE_OFFLINE the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_OFFLINE.] ()

7.6.3 Transition between substate WAIT_TRCVLINK and WAIT_ONLINE

[SWS EthSM 00132] [

In the state ETHSM_STATE_WAIT_TRCVLINK the state machine shall have a transition to ETHSM_STATE_WAIT_ONLINE, if the Ethernet Interface reports ETHTRCV_LINK_STATE_ACTIVE for the corresponding network handle. In this

transition the EthSM shall interact like specified in the sequence diagram Figure 9-1.

[SWS_EthSM_00133] [

The transition from ETHSM_STATE_WAIT_TRCVLINK to ETHSM_STATE_WAIT_ONLINE shall request the Tcplp state TCPIP_STATE_ONLINE from the Tcplp module.] ()

[SWS_EthSM_00134][

After the successful transition from ETHSM_STATE_WAIT_TRCVLINK to ETHSM_STATE_WAIT_ONLINE the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_WAIT_ONLINE.] ()

[SWS EthSM 00136] [

In the state ETHSM_STATE_WAIT_ONLINE the state machine shall have a transition to ETHSM_STATE_WAIT_TRCVLINK, if the Ethernet interface reports ETHTRCV_LINK_STATE_DOWN for the corresponding network handle. ()

[SWS EthSM 00137] [

The transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_WAIT_TRCVLINK shall request the Tcplp state TCPIP_STATE_OFFLINE from the Tcplp module.| ()

[SWS EthSM 00138][

After the successful transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_WAIT_TRCVLINK the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_WAIT_TRCVLINK.] ()

7.6.4 Transition from substate WAIT_ONLINE to OFFLINE

[SWS EthSM 00140] [

In the state ETHSM_STATE_WAIT_ONLINE the state machine shall have a transition to ETHSM_STATE_OFFLINE, if the ComM requests COMM_NO_COMMUNICATION for the corresponding network handle.| ()

[SWS_EthSM_00141] [

The transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_OFFLINE sets the controller mode to ETH_MODE_DOWN. | ()

[SWS EthSM 00142] [

The transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_OFFLINE sets the transceiver mode to ETHTRCV_MODE_DOWN.| ()

[SWS_EthSM_00143]] [

The transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_OFFLINE shall request the Tcplp state TCPIP_STATE_OFFLINE from the Tcplp module. ()

[SWS_EthSM_00144][

After the successful transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_OFFLINE the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_OFFLINE.] ()

7.6.5 Transition between substate WAIT ONLINE and ONLINE

[SWS EthSM 00146] [

In the state ETHSM_STATE_WAIT_ONLINE the state machine shall have a transition to ETHSM_STATE_ONLINE, if the Tcplp modul reports TCPIP_STATE_ONLINE for the corresponding network handle. In this transition the EthSM shall interact like specified in the sequence diagram Figure 9-1.| ()

[SWS EthSM 00148][

After the successful transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_ONLINE the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_ONLINE.| ()

[SWS EthSM 00150]][

After the successful transition from ETHSM_STATE_WAIT_ONLINE to ETHSM_STATE_ONLINE the Ethernet State Manager shall call the callback function ComM_BusSM_ModeIndication of the ComM and transmit the communication mode (COMM_FULL_COMMUNICATION).(()

[SWS EthSM 00151] [

In the state ETHSM_STATE_ONLINE the state machine shall have a transition to ETHSM_STATE_WAIT_ONLINE, if the Tcplp modul reports TCPIP_STATE_OFFLINE for the corresponding network handle.| ()

[SWS EthSM 00152] [

After the successful transition from ETHSM_STATE_ONLINE to ETHSM_STATE_WAIT_ONLINE the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_WAIT_ONLINE.| ()

[SWS EthSM 00154]][

The transition from ETHSM_STATE_ONHOLD to ETHSM_STATE_OFFLINE sets the transceiver mode to ETHTRCV_MODE_DOWN.| ()

[SWS EthSM 00181][

The transition from ETHSM_STATE_ONHOLD to ETHSM_STATE_OFFLINE shall request the Tcplp state TCPIP_STATE_OFFLINE from the Tcplp module.| ()

[SWS EthSM 00182][

After the successful transition from ETHSM_STATE_ONHOLD to ETHSM_STATE_OFFLINE the Ethernet State Manager shall call the callback function BswM_EthSM_CurrentState of the BswM and transmit the internal state ETHSM_STATE_OFFLINE.] ()

[SWS_EthSM_00184][

After the successful transition from ETHSM_STATE_ONHOLD to ETHSM_STATE_OFFLINE the Ethernet State Manager shall call the callback function ComM_BusSM_ModeIndication of the ComM and transmit the communication mode (COMM_NO_COMMUNICATION). | ()

7.6.11 Information about state transitions

[SWS_EthSM_00083] [

After the state machine has finished a state transition, the Ethernet State Manager has to inform the ComM and the BswM about the actual state of the Ethernet State Manager (see Figure 9-1 and Figure 9-2).

The ComM needs the information about the communication states, e.g. COMM FULL COMMUNICATION or COMM NO COMMUNICATION.

The BswM needs the information about the EthSM internal states, see [SWS_EthSM_00041].| ()

7.7 Error notification

For details refer to the chapters 7.2.2 "Error classification" & 7.2.3 "Development Errors" in SWS BSWGeneral.

7.8 Error classification

7.8.1 Development Errors

Type or error	Related error code	Value [hex]
Invalid communication mode requested	ETHSM_E_INVALID_NETWORK_MODE	0x01
EthSM module was not initialized	ETHSM_E_UNINIT	0x02
Invalid pointer in parameter list	ETHSM_E_PARAM_POINTER	0x03
Invalid parameter in parameter list	ETHSM_E_INVALID_NETWORK_HANDLE	0x04
Invalid parameter in parameter list	ETHSM_E_PARAM_CONTROLLER	0x07

7.8.2 Runtime Errors

Type or error			Related error code	Value [hex]
Invalid	parameter	in	ETHSM E INVALID TCP IP MODE	0x05
parameter list				

7.8.3 Transcient Faults

There are no transient faults.

7.8.4 Production Errors

Error Name:	ETHSM_E_LINK_DOWN		
Short Description:	Link down detection		
Long Description:	It shall be reported when the transceiver switches to "down" while communication has already been established and is requested because of communication request		
Recommended DTC:	N/A		
Detection Criteria:	FAIL PASS	During transition from ETHSM_STATE_ONLINE to ETHSM_STATE_ONHOLD, which is triggered by EthSM_TrcvLinkStateChg(ETHTRCV_LINK_STATE_DOWN) During transition from ETHSM_STATE_ONHOLD to	
	PASS	During transition from ETHSM_STATE_ONHOLD to ETHSM_STATE_ONLINE, which is triggered by EthSM_TrcvLinkStateChg(ETHTRCV_LINK_STATE_ACTIVE)	
Secondary Parameters:	None		
Time Required:	PRE_FAIL: Immediately PASS: Configuration dependent		
Monitor Frequency	Continuous		
MIL illumniation:	N/A		

7.8.5 Extended Production Errors

There are no extended production errors.

7.9 Debugging

Note: The debugging specifications are obsolete and will be removed from the standard in an upcoming release.

[SWS_EthSM_00076] {OBSOLETE}

The state ETHSM_STATE_OFFLINE shall be available for debugging.| ()

[SWS_EthSM_00077] {OBSOLETE}

The state ETHSM_STATE_WAIT_TRCVLINK shall be available for debugging. ()

[SWS_EthSM_00075] {OBSOLETE}

The state ETHSM STATE WAIT ONLINE shall be available for debugging. ()

[SWS_EthSM_00185] {OBSOLETE}

The state ETHSM_STATE_ONLINE shall be available for debugging | ()

[SWS_EthSM_00186] {OBSOLETE}

[The state ETHSM_STATE_ONHOLD shall be available for debugging .]()

[SWS_EthSM_00187] {OBSOLETE}

[The state ETHSM_STATE_WAIT_OFFLINE shall be available for debugging.]()

Additional recommendation:

For all defined states, it shall be possible to identify them during debugging. In this case, it should be recommended, that these states are available for debugging.

7.10 Commercial Off The Shelf stack usage

A commercial off the shelf stack (COTS) shall be useable. The commercial stack is useable without adaptation (Variant 1 in Figure 7-2). However, the Ethernet State Manager is not able to control the Ethernet controller and Ethernet transceiver in this case. The commercial stack may be adapted for usage with the Ethernet Interface. In this case, the Ethernet State Manager is able to control both Ethernet controller and Ethernet transceiver (Variant 2 in Figure 7-2).

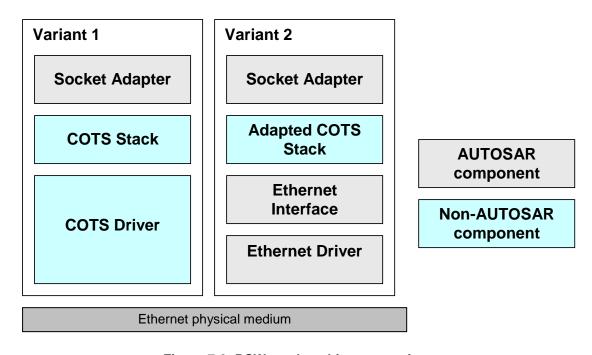

Figure 7-2: BSW stack architecture variants

[SWS EthSM 00078][

It is possible to set the Ethernet State Manager in a dummy mode (see chapter 10 configuration specification). In this mode, the Ethernet State Manager doesn't support the API to the Ethernet interface. The API to the ComM is available but the functionality is deactivated. The function calls from the ComM will be answered with the return value E_OK.| ()

8.2 Type definitions

8.2.1 EthSM_NetworkModeStateType

[SWS_EthSM_00041] [

Name:	EthSM_NetworkModeStateType		
Туре:	Enumeration		
Range:	ETHSM_STATE_OFFLINE	EthSM is initialized in this state.	
	ETHSM_STATE_WAIT_TRCVLINK	ComM requests COMM_FULL_COMMUNICATION in this state. Controller and transceiver will be set to ACTIVE. EthSM waits for transceiver link state (ACTIVE).	
	ETHSM_STATE_WAIT_ONLINE	Transceiver link state is ACTIVE EthSM waits for IP communication (TcpIP state = ONLINE)	
	ETHSM_STATE_ONLINE	IP communication is available ComM state COMM_FULL_COMMUNICATION is reached	
	ETHSM_STATE_ONHOLD	EthSM lost active transceiver link state, TcpIP state is still ONLINE)	
	ETHSM_STATE_WAIT_OFFLINE	ComM requests COMM_NO_COMMUNICATION in this state.	
Description:	This type shall define the states or	f the network mode state machine.	

] ()

8.3 Function definitions

This is a list of functions provided for upper layer modules.

Note:

Depending on the Ethernet hardware, it may become necessary that implementations deviate from API specifications in respect to the asynchronous/synchronous behaviour.

8.3.1 EthSM_Init

[SWS_EthSM_00043] [

Service name:	EthSM_Init
Syntax:	void EthSM_Init(
	void
])
Service ID[hex]:	0x07
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	None
Parameters	None
(inout):	
Parameters (out):	None
Return value:	None
Description:	This function initialize the EthSM.

| (BSW0405, SRS_BSW_00101, SRS_BSW_00358, SRS_BSW_00414)

8.3.2 EthSM GetVersionInfo

[SWS_EthSM_00046] [

Service name:	EthSM_GetVersionInfo		
Syntax:	void EthSM GetVersionInfo(
	Std_VersionInfoType* versioninfo		
)		
Service ID[hex]:	0x02		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters	None		
(inout):			
Parameters (out):	versioninfo Pointer where to put out the version information.		
Return value:	None		
Description:	This service puts out the version information of this module.		

(SRS_BSW_00407, SRS_BSW_00003)

8.3.3 EthSM_RequestComMode

[SWS_EthSM_00050] [

Service name:	EthSM_RequestCo	omMode
Syntax:	NetworkHar	e EthSM_RequestComMode(ndleType NetworkHandle, Type ComM_Mode
Service ID[hex]:	0x05	
Sync/Async:	Asynchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	NetworkHandle ComM_Mode	Handle of destinated communication network for request Requested communication mode
Parameters (inout):	None	•
Parameters (out):	None	
Return value:	Std_ReturnType	E_OK: Service accepted E_NOT_OK: Service denied
Description:	Handles the comm passive.	nunication mode and sets the Ethernet network active or

1 ()

Remark: The function reentrancy is limited to different network handles. Reentrancy for the same network is not to be regarded here.

[SWS_EthSM_00051] [

The function <code>EthSM_RequestComMode</code> checks the network handle of the request. It only accepts the request, if the network handle of the request is a handle contained in the <code>EthSM</code> configuration (configuration parameter <code>EthSMNetworkHandle</code>). In this case the return value is set to E OK.

If it is not contained in the configuration, the function denies the request. In this case the return value is set to E_NOT_OK.| ()

[SWS_EthSM_00052] [

[SWS_EthSM_00095] [

The function <code>EthSM_RequestComMode</code> shall report <code>ETHSM_E_INVALID_NETWORK_MODE</code> to the DET, if it does not accept the ComM_Mode of the request.| ()

[SWS_EthSM_00053] [

If the function EthSM_RequestComMode accepts the function call, it shall store the communication mode for the network handle and the corresponding network mode switch of the state machine shall be initiated in the next main function cycle latest. ()

[SWS_EthSM_00054] [

The function EthSM_RequestComMode shall report ETHSM_E_UNINIT to the DET, if the EthSM is not initialized yet.| (SRS BSW 00406)

[SWS_EthSM_00199][

The function $EthSM_RequestComMode$ shall accept SilentCom request from ComM and will return E_OK . No error shall be reported to ComM in this case, though SilentCom is not available according to SWS_EthSM_00087 ()

8.3.4 EthSM_GetCurrentComMode

[SWS_EthSM_00055] [

Service name:	EthSM_GetCurrentComMode
Syntax:	<pre>Std_ReturnType EthSM_GetCurrentComMode(NetworkHandleType NetworkHandle, ComM_ModeType* ComM_ModePtr)</pre>
Service ID[hex]:	0x04
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	NetworkHandle Network handle whose current communication mode shall be put out
Parameters (inout):	None
Parameters (out):	ComM_ModePtr Pointer where to put out the current communication mode
Return value:	Std_ReturnType E_OK: Service accepted E_NOT_OK: Service denied
Description:	This service shall put out the current communication mode of a Ethernet network.

1 ()

[SWS_EthSM_00057] [

The function <code>EthSM_GetCurrentComMode</code> checks the network handle of the service request. It only accepts the service, if the network handle of the request is a handle contained in the <code>EthSM</code> configuration (configuration parameter <code>EthSMNetworkHandle</code>). In this case the return value is set to E OK.

If it is not contained in the configuration, the function denies the request. In this case the return value is set to E_NOT_OK.] ()

[SWS_EthSM_00058] [

The function <code>EthSM_GetCurrentComMode</code> shall report <code>ETHSM_E_INVALID_NETWORK_HANDLE</code> to the DET, if it does not accept the network handle of the request. I ()

[SWS EthSM 00059] [

The function $EthSM_GetCurrentComMode$ puts out the current communication mode for the network handle to the designated pointer of type $ComM_ModeType$, if it accepts the request. | ()

Remark: Because the Ethernet hardware needs a certain time to proceed with the request and there is currently no notification mechanism specified, the real hardware mode and the mode notified by the EthSM might be different until the hardware is ready.

[SWS_EthSM_00060] [

The function EthSM_GetCurrentComMode shall report ETHSM_E_UNINIT to the DET, if the EthSM is not initialized yet. J (SRS_BSW_00406, SRS_BSW_00374, SRS_BSW_00379, SRS_BSW_00003, SRS_BSW_00318)

8.3.5 EthSM_TcplpModeIndication

SWS EthSM 00110

Service name:	EthSM_TcplpMc	odeIndication
Syntax:	<pre>Std_ReturnType EthSM_TcpIpModeIndication(uint8 CtrlIdx, TcpIp_StateType TcpIpState)</pre>	
Service ID[hex]:	0x08	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):		EthIf controller index to identify the communication network where the TcpIp state is changed Actual TcpIp state of the specific network handle
Parameters (inout):	None	
Parameters (out):	None	
Return value:		E_OK: Service accepted E_NOT_OK: Service denied
Description:	This service is called by the Tcplp to report the actual Tcplp state (e.g. online, offline).	

1 ()

[SWS_EthSM_00116] [

If the function <code>EthSM_TcpIpModeIndication</code> gets a Ctrlldx, which is not configured in the configuration of the EthSM module, it shall call the function <code>Det_ReportError</code> with <code>ErrorId</code> parameter <code>ETHSM_E_PARAM_CONTROLLER.</code>] () In this case the return value is set to <code>E_NOT_OK</code>.

[SWS EthSM 00118] [

If default error detection is enabled, the parameter TcplpState shall be checked for being in the allowed range.

In case it is outside of the allowed range, the function $EthSM_TcpIpModeIndication$ shall ignore the state indication, report runtime error $ETHSM_E_INVALID_TCP_IP_MODE$ to the DETand return $E_NOT_OK.$ ()

[SWS_EthSM_00119] [

If the function <code>EthSM_TcpIpModeIndication</code> accepts the function call, it shall store the TcpIp state for the affected network handle and the corresponding network mode switch of the state machine shall be initiated in the next main function cycle latest.] ()

[SWS_EthSM_00120] [

The function EthSM_TcpIpModeIndication shall report ETHSM_E_UNINIT to the DET, if the EthSM is not initialized yet.] (SRS_BSW_00406)

8.3.6 EthSM_GetCurrentInternalMode

[SWS_EthSM_00121] [

Service name:	EthSM_GetCurrentInt	ternalMode
Syntax:	NetworkHandl	thSM_GetCurrentInternalMode(eType NetworkHandle, kModeStateType* EthSM_InternalMode
Service ID[hex]:	0x03	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):		Network handle whose current communication mode shall be put out
Parameters (inout):	None	
Parameters (out):	EthSM_InternalMode	Pointer where to put out the current internal mode
Return value:		E_OK: Service accepted E_NOT_OK: Service denied
Description:	This service shall put	out the current internal mode of a Ethernet network.

1 ()

[SWS_EthSM_00122] [

The function EthSM_GetCurrentInternalMode checks the network handle of the service request. It only accepts the service, if the network handle of the request is a handle contained in the EthSM configuration (configuration parameter EthSMNetworkHandle). In this case the return value is set to E OK.

If it is not contained in the configuration, the function denies the request. In this case the return value is set to E_NOT_OK.] ()

[SWS_EthSM_00123] [

The function ${\tt EthSM_GetCurrentInternalMode}$ shall report ${\tt ETHSM_E_INVALID_NETWORK_HANDLE}$ to the DET, if it does not accept the network handle of the request.] ()

[SWS_EthSM_00124] [

The function <code>EthSM_GetCurrentInternalMode</code> puts out the current internal mode for the network handle to the designated pointer of type <code>EthSM_NetworkModeStateType</code>, if it accepts the request.] ()

[SWS_EthSM_00125] [

The function EthSM_GetCurrentInternalMode shall report ETHSM_E_UNINIT to the DET, if the EthSM is not initialized yet.| ()

8.4 Call-back notifications

This is a list of functions provided for other modules. The function prototypes of the callback functions shall be provided in the file <Module Prefix>_Cbk.h

8.4.1 EthSM CtrlModeIndication

[SWS_EthSM_00190][

Service name:	EthSM_CtrlMod	eIndication	
Syntax:	<pre>void EthSM_CtrlModeIndication(uint8 CtrlIdx, Eth_ModeType CtrlMode)</pre>		
Service ID[hex]:	0x09		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant (only	Reentrant (only for different Ethernet controllers)	
Paramatara (in)	Ctrlldx	Ethernet controller whose mode has changed	
Parameters (in):	CtrlMode	Notified Ethernet controller mode	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	Called when mode has been read out. Either triggered by previous EthIf_GetControllerMode or by EthIf_SetControllerMode call. Can directly be called within the trigger functions.		

] ()

[SWS_EthSM_00191][

If the function EthSM_CtrlModeIndication gets a CtrlIdx, which is not configured in the configuration of the EthSM module, it shall call the function Det ReportError with ErrorId parameter ETHSM E PARAM CONTROLLER. ()

[SWS_EthSM_00192][

the **EthSM** module is not initialized, when the function EthSM CtrlModeIndication is called. then the function EthSM CtrlModeIndication shall call the function Det ReportError with ErrorId parameter ETHSM E UNINIT. | ()

8.4.2 EthSM_TrcvModeIndication

[SWS EthSM 00193][

Service name:	EthSM_TrcvModeIndication	
Syntax:	void EthSM_TrcvModeIndication(
	uint8 CtrlIdx,	
	EthTrcv_ModeType TrcvMode	

)		
Service ID[hex]:	0x0a		
Sync/Async:	Synchronous	Synchronous	
Reentrancy:	Reentrant (only for different Ethernet controllers)		
Parameters (in):		Index of the Ethernet controller within the context of the Ethernet Interface	
	TrcvMode	Notified Ethernet transceiver mode	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	None		
Description:	Called when mode has been read out. Either triggered by previous EthIf_GetTransceiverMode or by EthIf_SetTransceiverMode call. Can directly be called within the trigger functions.		

] ()

[SWS_EthSM_00194][

If the function <code>EthSM_TrcvModeIndication</code> gets a <code>CtrlIdx</code>, which is not configured as in the configuration of the <code>EthSM</code> module, it shall call the function <code>Det_ReportError</code> with <code>ErrorId</code> parameter <code>ETHSM_E_PARAM_CONTROLLER.</code>] ()

[SWS_EthSM_00195][

the **EthSM** module is not initialized, when the function called, EthSM TrcvModeIndication is then the function EthSM TrcvModeIndication shall call the function Det ReportError with Errorid parameter ETHSM E UNINIT. ()

8.4.3 EthSM_TrcvLinkStateChg

[SWS_EthSM_00109]

Service name:	EthSM_TrcvLinkStateChg
Syntax:	<pre>void EthSM_TrcvLinkStateChg(uint8 CtrlIdx, EthTrcv_LinkStateType TransceiverLinkState)</pre>
Service ID[hex]:	0x06
Sync/Async:	Synchronous
Reentrancy:	Non Reentrant
Parameters (in):	Ctrlldx Index of the Ethernet controller within the context of the Ethernet Interface TransceiverLinkState Actual transceiver link state of the specific network handle
Parameters (inout):	None
Parameters (out):	None
Return value:	None
Description:	This service is called by the Ethernet Interface to report a transceiver link state change.

] ()

[SWS_EthSM_00112] [

The function EthSM_TrcvLinkStateChg shall report ETHSM_E_PARAM_CONTROLLER to the DET, if it does not accept the CtrlIdx of the function call. ()

[SWS_EthSM_00114] [

If the function <code>EthSM_TrcvLinkStateChg</code> does not report a DET error, it shall store the transceiver link state for the affected network handle and the corresponding network mode switch of the state machine shall be initiated in the next main function cycle latest. | ()

[SWS_EthSM_00115] [

The function <code>EthSM_TrcvLinkStateChg</code> shall report <code>ETHSM_E_UNINIT</code> to the DET, if the EthSM is not initialized yet.] (SRS_BSW_00406)

8.5 Scheduled functions

These functions are directly called by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

8.5.1 EthSM_MainFunction

[SWS EthSM 00035] [

Service name:	EthSM_MainFunction	
Syntax:	void EthSM_MainFunction(
	void	
Service ID[hex]:	0x01	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	None	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	None	
Description:	Cyclic Main Function which is called from the Scheduler.	

1 ()

[SWS_EthSM_00093] [

The function EthSM_MainFunction shall be called cyclically with a fixed cycle time. The cycle time could be defined via the configuration parameter ETHSM_MAIN_FUNCTION_PERIOD.] ()

[SWS EthSM 00197]

The main function of the EthSM module shall operate the effects of the EthSM state machine, which the EthSM module shall implement for each configured network. | ()

[SWS_EthSM_00198]

The EthSM shall monitor the requested and current state of the Ethernet Controller and the Ethernet Transceiver. If the EthSM detects a mismatch, it shall bring the hardware back to the corresponding state.

(i.e. FullCOM requires the state ETH_MODE_ACTIVE and ETHTRCV_MODE_ACTIVE; NoCom requires ETH_MODE_DOWN and ETHTRCV_MODE_DOWN).

8.6 Expected Interfaces

In this chapter all interfaces required from other modules are listed.

8.6.1 Mandatory Interfaces

This chapter defines all interfaces which are required to fulfill the core functionality of the module.

API function	Description
BswM_EthSM_CurrentState	Function called by EthSM to indicate its current state.
	Indication of the actual bus mode by the corresponding Bus State Manager. ComM shall propagate the indicated state to the users with means of the RTE and BswM.
	Queues the reported events from the BSW modules (API is only used by BSW modules). The interface has an asynchronous behavior, because the processing of the event is done within the Dem main function. OBD Events Suppression shall be ignored for this computation.
EthIf_SetControllerMode	Enables / disables the indexed controller
EthIf_SetTransceiverMode	Enable / disable the indexed transceiver
Tcplp_RequestComMode	By this API service the TCP/IP stack is requested to change the TcpIp state of the communication network identified by EthIf controller index.

8.6.2 Optional Interfaces

This chapter defines all interfaces which are required to fulfill an optional functionality of the module.

API function	Description
Det_ReportError	Service to report development errors.
EthIf_GetControllerMode	Obtains the state of the indexed controller
EthIf_GetTransceiverMode	Obtain state of the indexed transceiver

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module EthSM.

Chapter 10.3 specifies published information of the module EthSM.

10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in SWS_BSWGeneral.

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

10.2.1 Configuration Tool

[SWS_EthSM_00081][

A configuration tool will create a configuration structure that is understood by the EthSM.| (SRS_BSW_00159, SRS_BSW_00424, SRS_BSW_00425)

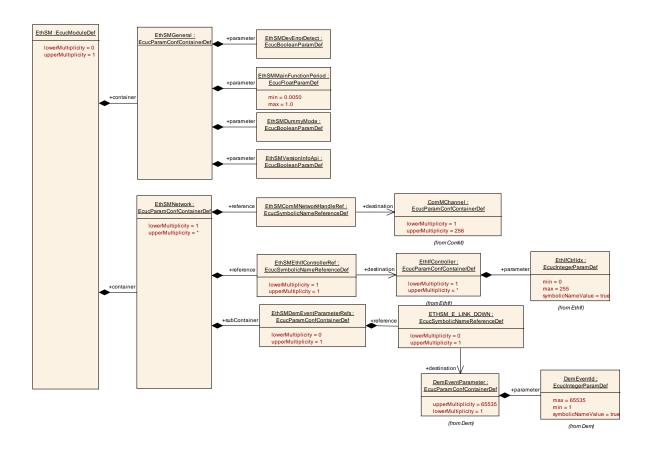

10.2.2 Variants

[SWS EthSM 00061] [

Actual the only provided configuration variant is the use of pre-compile parameters. Not provided are link time parameters, post build time parameters or mixes of them.

Variant 1: Only pre-compile parameters (SRS_BSW_00345)

10.2.3 EthSMGeneral

SWS Item	ECUC_EthSM_00063:
Container Name	EthSMGeneral
Description	This container contains the global parameter of the Ethernet State Manager.
Configuration Parameters	

SWS Item	ECUC_EthSM_00065:			
Name	EthSMDevErrorDetect			
Description	Switches the Default Error Tracer (Det) detection and notification ON or OFF. • true: enabled (ON).			
	false: disabled (OFF).			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_EthSM_00079:

Name	EthSMDummyMode			
	Disables the API to the Ethlf. The API to the ComM is available but the functionality is deactivated. The function calls from the ComM will be answered with the return value E_OK.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false	false		
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_EthSM_00066:		
Name	EthSMMainFunctionPeriod		
Description	Specifies the period in secor	nds tha	at the MainFunction has to be triggered
	with.		
Multiplicity	1

Scope / Dependency	scope: local			

No Included Containers

10.2.4 EthSMNetwork

SWS Item	ECUC_EthSM_00067:
Container Name	EthSMNetwork
Description	This container contains the Ethernet network-specific parameters of each Ethernet network. It also contains the controller and transceiver IDs assigned to a Ethernet network.
Configuration Parameters	

SWS Item	ECUC_EthSM_00068:
Name	EthSMComMNetworkHandleRef
Description	Unique handle to identify one certain Ethernet network. Reference to one

	of the network handles configured for the ComM.			
Multiplicity	1			
Туре	Symbolic name reference to [ComMChannel]			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time

SWS Item	ECUC_EthSM_00105:			
Name	EthSMEthlfControllerRef			
Description	Reference to EthIfCtrl contai	ner w	here a ETH controller and	
	transceiver (optional) combir	nation	is configured.	
Multiplicity	1			
Туре	Symbolic name reference to [EthlfController]			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Pre-compile time X All Variants		
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

Included Containers					
Container Name	Multiplicity	Scope / Dependency			
EthSMDemEventParameterRef s	01	Container for the references to DemEventParameter elements which shall be invoked using the API Dem_ReportErrorStatus API in case the corresponding error occurs. The EventId is taken from the referenced DemEventParameter's DemEventId value. The standardized errors are provided in the container and can be extended by vendor specific error references.			

10.2.5 EthSMDemEventParameterRefs

SWS Item	ECUC_EthSM_00106:
Container Name	EthSMDemEventParameterRefs
Description	Container for the references to DemEventParameter elements which shall be invoked using the API Dem_ReportErrorStatus API in case the corresponding error occurs. The EventId is taken from the referenced DemEventParameter's DemEventId value. The standardized errors are provided in the container and can be extended by vendor specific error references.
Configuration Parameters	

SWS Item	ECUC_EthSM_00107:			
Name	ETHSM_E_LINK_DOWN	ETHSM_E_LINK_DOWN		
Description	Reference to configured DEM event to report bus off errors for this Eth network.			
Multiplicity	01			
Туре	Symbolic name reference to [DemEventParameter]			
Post-Build Varian Multiplicity	false			
Post-Build Variant Value	false			
Multiplicity Configuration	Pre-compile time X All Variants			
Class	Link time			

	Post-build time		
Value Configuration Class	Pre-compile time	Χ	All Variants
	Link time
